determining a current cursor position representing a location in the source code module where the user is currently providing input;

determining input items which are suitable for input in the source code module at the current cursor position;

displaying to the user a list of said suitable input items; and
in response to selection by the user of a particular item from the list,
automatically completing input at the current cursor position;

wherein said detecting step includes:

<u>determining instances in the source code module where the system can</u> <u>automatically provide input; and</u>

wherein said detecting step includes:

determining in the source code module use of a structure variable which references a nested data member.

8. - 9. --CANCELLED--

10. (Amended) [The method of claim 1,] <u>In a development system, a method</u> for assisting a user with inputting source code for a computer program, the method comprising:

detecting a need for assisting the user with input for a source code module under development;

determining a current cursor position representing a location in the source code module where the user is currently providing input;

determining input items which are suitable for input in the source code module at the current cursor position;

displaying to the user a list of said suitable input items; and
in response to selection by the user of a particular item from the list,
automatically completing input at the current cursor position;

Serial No. 08/942,782 2

wherein said current cursor position comprises a line number and a column position for a particular source code file.

11. --CANCELLED--

cursor position; and

12. (Allowed) In a development system, a method for assisting a user with inputting source code for a computer program, the method comprising:

detecting a need for assisting the user with input for a source code module under development;

determining a current cursor position representing a location in the source code module where the user is currently providing input;

determining input items which are suitable for input in the source code module at the current cursor position;

displaying to the user a list of said suitable input items; and

in response to selection by the user of a particular item from the list, automatically completing input at the current cursor position;

wherein said step of determining input items which are suitable for input in the source code module includes:

determining which variables are within scope for the current cursor position; and eliminating as a suitable input item any item that is not within scope for the current

wherein said step of determining input items which are suitable for input in the source code module at the current cursor position includes:

compiling the source code module up to the current cursor position.

13. (Amended) [The method of claim 11,] <u>In a development system, a method</u> for assisting a user with inputting source code for a computer program, the method comprising:

detecting a need for assisting the user with input for a source code module under development;

determining a current cursor position representing a location in the source code module where the user is currently providing input;

Serial No. 08/942,782

determining input items which are suitable for input in the source code module at the current cursor position;

displaying to the user a list of said suitable input items; and
in response to selection by the user of a particular item from the list,
automatically completing input at the current cursor position;

wherein said step of determining input items which are suitable for input in the source code module includes:

determining which variables are within scope for the current cursor position; and

eliminating as a suitable input item any item that is not within scope for the current cursor position; and

wherein said step of compiling the source code module up to the current cursor position includes:

skipping compilation of any method defined in the source code unless the cursor is currently positioned within the method.

14. (Amended) [The method of claim 1,] <u>In a development system, a method</u> for assisting a user with inputting source code for a computer program, the method comprising:

detecting a need for assisting the user with input for a source code module under development;

determining a current cursor position representing a location in the source code module where the user is currently providing input;

determining input items which are suitable for input in the source code module at the current cursor position;

displaying to the user a list of said suitable input items; and
in response to selection by the user of a particular item from the list,
automatically completing input at the current cursor position;
